

A Screensaver-Style UI For Passive Flashcard Learning

by Kolja Sam Pluemer, 26-02-05

Problem

- Sometimes, active recall and the continuous choice of flipping another flashcard feels tedious
- In this case, we want to enable the learner to still learn a little, instead of quitting the application

Approach

- Multiple due flashcards simply float on the screen, allowing the learner to remember learning content, and perhaps make connections between learning content

Future Work

- Testing the efficacy of this approach is very difficult, since we only have the coarsest of measures which cards the user actually studied. I would love some smart approach here.
